Status of Integrated Database at BSH (HPD)

The Nautical Hydrographic Information System (NAUTHIS) at BSH is a project aiming at building a single product-independent GIS data base allowing the production and maintenance of ENC's, paper charts, nautical publications and AMLs. The structure of the data base shall conform to S-57. The CARIS HPD software is used as basis for NAUTHIS. This software which is under development already for several years, is subject to a joint venture of BSH with CARIS where CARIS is doing the development and marketing, and BSH is responsible for specifications and beta-testing.

With the release of HPD 2.4, the project will reach its first goals, i.e. the integrated production of ENC's and paper charts.

A latest update to the NAUTHIS implementation will be given at the Conference.
