Deloitte.

Final event

Impact assessment study on the list of High Value Datasets to be made available by the Member States under the PSI Directive

Agenda

10h00 — 10h20	Welcome and introduction: EU Data Strategy and high-value datasets
10h20 — 11h30	Presentation of the study results – Part I
11h30 — 12h00	Opinions, questions and answers – Part I
12h00 — 13h00	Lunch break
13h00 — 13h30	Presentation of the study results – Part II
13h30 — 14h45	Opinions, questions and answers – Part II
14h45 — 15h00	Closing

House rules

The netiquette to follow for this online meeting

A **few simple rules** apply to this online focus group:

- The moderator is introducing the topic/the question and then opening the floor for the discussions. The moderator's goal is to generate a maximum number of different ideas and opinions from as many different people in the time allotted so he/she might ask you directly your opinion in case you have not had the chance to intervene on a certain topic yet.
- You can ask for the floor by requesting it in the chatbox on GoToWebinar (see control
 panel on the right of your screen). The moderator will give you the floor as soon as
 possible.
- **Keep your intervention short and to the point.** This will allow us to stick to the time allocated for each part of the agenda.
- Mute yourself when you are not speaking to avoid echoes and background noises.
- Enjoy the discussion!

and high-value datasets

DG CNECT G.1

Yvo Volman Head of Unit - Data Policy & Innovation

About the study Sebastiaan van der Peijl Deloitte

About the study (1/3)

Objectives and scope

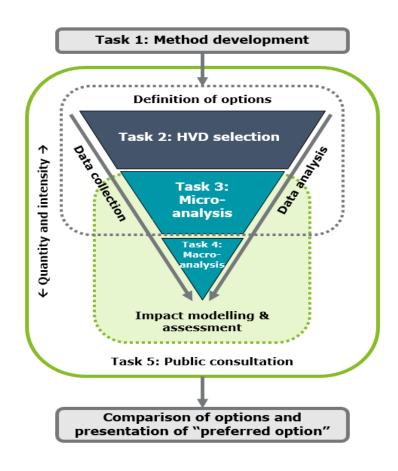

The overall objective of this assignment is to « define concrete High Value Datasets that fall under the thematic categories included in the Annex of the revised Directive, based on an iterative process involving a number of cycles, by which an initial broad range of datasets will be narrowed down. »

Main content scope

- The categories of high value datasets identified in Annex I of the Directive (geospatial, earth observation and environment, meteorological, statistics, companies and company ownership, transport);
- The other areas of legislation (at the European level) which cover the provision of certain datasets by public sector authorities and must be taken into account for ensuring that the overall legislative framework on public sector information is coherent and effective.

Additional aspects to take into account

- Business models of bodies who are currently charging for data and how these will be affected by the Directive;
- Competition issues for public undertakings opening up high value datasets whereas their private competitors do not have the same obligation;
- Importance of high value datasets for SMEs and for building AI applications and services.

About the study (2/2)

Overall methodological data collection and analysis tools

DATA COLLECTION TOOLS

DATA ANALYSIS METHODS

Development of a methodology for the identification and quantification of socio-economic benefits of HVD

Definition of HVD and presentation of possible options for regulatory intervention

Analysis of the possible impacts of the changed pricing structure for reuse of HVD (micro-level analysis)

Finalisation of socio-economic analysis for selected policy options (macro-level analysis)

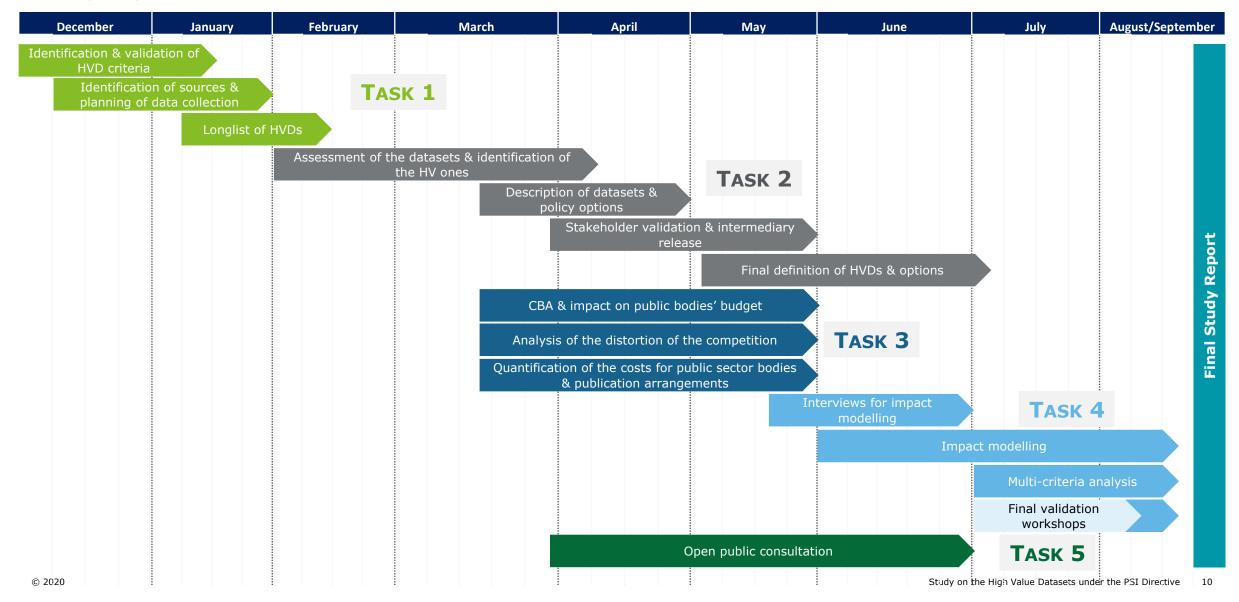

Public consultation and hearing

Main data collection activities across tasks: interviews, online focus groups and desk research.

About the study (3/3)

Timeline

About this session Contents

Policy intervention options per thematic area

Parameters examined for policy intervention options

Number of data fields or Measures for publication datasets to be included as highvalue datasets **Policy options Lower intensity Higher intensity** intervention intervention

A value framework for HVDs Josh D'Addario The ODI

Finalised value framework for HVDs (1/12) Methodology

A literature review was conducted to collate categories of value related to the six macro characteristics of potential value:

Climate Change	Economic \$	Innovation and AI
Public Services and Administration	Reuse	Social

The review carried out by the study team generated **32 categories of value**, **supported by 126 quantitative and qualitative indicators**, within the six characteristics.

Finalised value framework for HVDs (2/12) **Methodology**

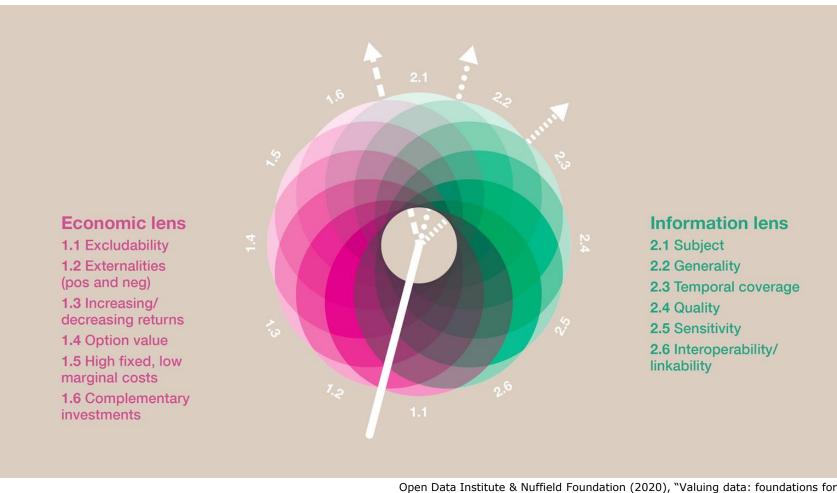

The realisation of value with open data can be considered through two lenses

INFORMATIONAL

Associated with the relation and conveyance of information

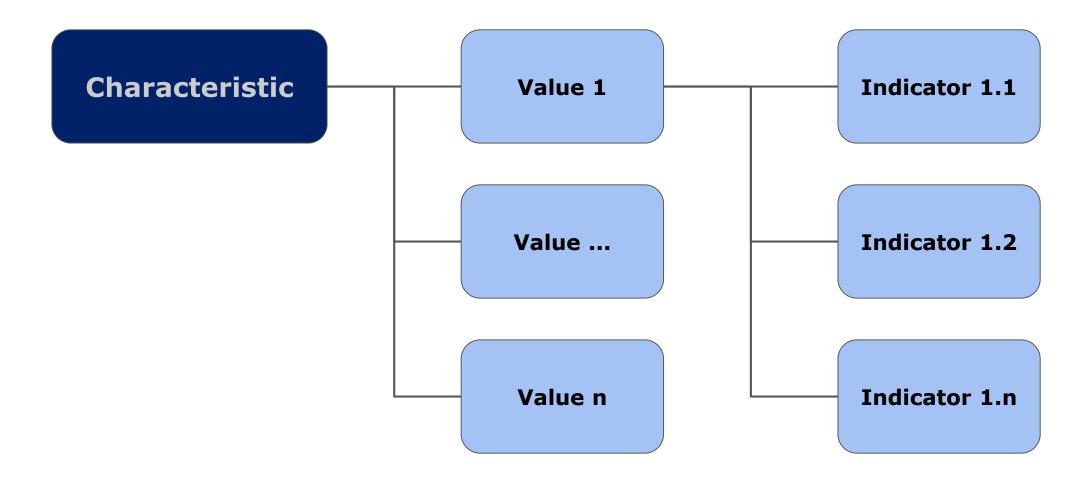

ECONOMIC

Associated with the production, distribution and consumption of data

Open Data Institute & Nuffield Foundation (2020), "Valuing data: foundations for data policy",

Finalised value framework for HVDs (3/12) Framework

Finalised value framework for HVDs (4/12)

Framework

Open data exploited for understanding and improving environmental conditions and addressing climate change

Citizen engagement in addressing climate change

Citizen understanding of climate change issues; Number of citizen-led environmental initiatives

Climate change

CO2 emissions

Energy management and efficiency

Levels of energy use

Environment management

Air quality; Citizen use of waste disposal sites and schemes; Number of flood prevention schemes; Responsiveness to environmental emergencies

Finalised value framework for HVDs (5/12)

Framework

Economic |\$__

National income attributable to industries and activities that are based on the exploitation of open data - the value added of open data with respect to the economy as a whole and private sector expenditure on public sector information - and the creation of quality and decent jobs

Competition

Exit of inefficient firms; Improvements in performance of old firms; Lower firm input costs; Number and level of entry of firms

Consumer benefits

Attractiveness of products to consumers; Purchasing power of consumers

Economic output

Economic output from digital sectors; Market size; Rate of sector growth; Value added

Economy monitoring

Use of imports and exports information; Use of inflation and GDP information

Employment

Number of countries in which new jobs have been created; Number of new high value jobs created; Number of new jobs created; Number of new jobs in high value sectors created; Number of sectors in which jobs created; Rate of increase in the creation of new jobs; ...

Finalised value framework for HVDs (6/12)

Framework

Economic

\$

National income attributable to industries and activities that are based on the exploitation of open data - the value added of open data with respect to the economy as a whole and private sector expenditure on public sector information - and the creation of quality and decent jobs

International competitiveness

Level, range, and value of exports

Product market dynamism

Attractiveness of products to consumers; Diversity of products; Number of products bought by consumers; Prices optimization; Product improvement

Productivity and commercialisation

Citizen and firm ease of paying taxes; Efficiency of logistics; Level of business costs; Level of fraud; Level of market insight; Level of reporting demands on business; Level of sales by firms; Number and types of new business model; Number of new products and services; ...

Public-private coordination

Quality of coordination between public and private organisations

Trust and transaction costs

Efficiency of market transactions; Reliability and transparency of transactions in the real property sector; Reliability of market transactions

Finalised value framework for HVDs (7/12)

Framework

New services and applications created through the use of open data in the private sector - in particular by small and medium-size enterprises - or the public sector

Citizen innovation

Level of self-servicing by citizens

Entrepreneurialism and private sector innovation

Commercial use of public sector technology; Growth of firms using public data; Number of firms using public sector data; Number of new products and services

Public sector innovation

Number of registered developers of apps using public sector information

Public-private coordination

Number of hackathons and similar initiatives for private sector collaboration

Finalised value framework for HVDs (8/12)

Framework

Public Services and Administration

Open data exploited for public service delivery through access, efficiency, and quality improvements

Access to public services

Ease of access by citizens to healthcare facilities; Efficiency of school choices made by citizens; Quality of comparisons made by citizens between schools; Use of libraries

Public administration transparency, accountability & engagement

Access to voting locations; Public participation in political and social activities; Public understanding of legislative processes; Public understanding of political processes; Public understanding of public administration and spending

Public sector procurement

Level of competition in bidding

Finalised value framework for HVDs (9/12)

Framework

Public Services and Administration

Open data exploited for public service delivery through access, efficiency, and quality improvements

Public sector revenue

Level of tax revenue

Public services management

Cost of maintaining information on companies; Cost of publishing open data relative to previous costs, and returns; Efficiency of public spending allocation; Level of citizen requests for information from public sources; Location accuracy of public services provision; ...

Public services performance

Ability of public health services providers to predict risks to health; Improvements in school performance; Quality of healthcare services; Responsiveness of emergency services

Finalised value framework for HVDs (10/12)

Framework

Open data exploited by intermediaries for a high number of users, with potential for being combined with other datasets, and potential beneficiaries of value-added services and applications based on these datasets

Demand for information

Level of demand by country; Number of companies using information; Number of customer groups using public sector information portals; Number of established and returning users; Number of licences issued, delivered, sold; Number of new users; ...

Trust and confidence in information

User confidence in the market for re-use of public sector information

Volume and range of information

Download volume; Number of types of public sector information used

Finalised value framework for HVDs (11/12)

Framework

Open data exploited for improving transparency and accountability, and creating other important benefits for society

Crime and justice

Compliance with the law; Crime monitoring; Legal system efficiency; Public knowledge of legislation

Disease prediction and prevention

Disease detection; Disease prevention

Mobility access

Number of public transport users; Number of public transport users from marginal groups; Use of foot and cycle paths; Use of healthy mobility schemes by citizens

Finalised value framework for HVDs (12/12)

Framework

Open data exploited for improving transparency and accountability, and creating other important benefits for society

Mobility efficiency

Access to apps by public transport users; Awareness of mobility delays; Hours saved when searching for parking; Savings made from moving from SMS alerts; Time saved from avoiding congestion and delays; Time spent on public transport; Transport cost savings

Mobility planning

Ease of citizen transport planning; Numbers of people walking or cycling; Transport user satisfaction; Use of travel information data

Mobility systems planning

Mobility planning; Transport system integration

Company & Company Ownership

Maruca De Ramón Deloitte

Datasets in scope

 Name of the company (full version, in different languages when applicable); Company status (active, resolved, in liquidation, reconstruction, merger) Personal (Name(s) of company legal representative(s); Name of company's directors; The appointment, termination Accou 	entities; Non personal • Share	Personal	status
different languages when applicable); • Company status (active, resolved, in liquidation, reconstruction, merger) • Company status (active, resolved, in liquidation, reconstruction, merger) • Company status (active, resolved, in liquidation, reconstruction, merger) • The appointment, termination • Accou	ontition . Chara		
 Cessation date (if applicable); Historical names; Addresses (i.e. legal, visiting postal); Legal form; Identifiers (registration number / company identifier / tax identification number / phone number / e-mail address); Member State where registered; NACE code (of the predominant and secondary activities and the code's source); Number of employees; Turnover; Capital; Detailed information on branches and list of companies and list of companies dissolved), and persons who either as a body constituted pursuant to law or as members of any such body: are authorised to represent the company in dealings with third parties and in legal proceedings; it shall be apparent from the disclosure whether the persons authorised to represent the company and in legal proceedings; it shall be apparent from the disclosure whether the persons authorised to represent the company in dealings with third parties and in legal proceedings; it shall be apparent from the disclosure whether the persons authorised to represent the company in dealings with third parties and in legal proceedings; it shall be apparent from the disclosure whether the persons authorised to represent the company in dealings with third parties and in legal proceedings; it shall be apparent from the disclosure whether the persons authorised to represent the company authorised to represent the co	ced data on hes; noting nents, incl. ital statements, nancial ments, gement its, and other its (e.g. ital reports, reports, rate nance reports); group actions of the last e; companies nents which are led to the rity (i.e. anies' meeting es). (percentage) of ownership, and nature and extent of Beneficial Interest held (in shareholdin g and/or voting rights) as well as legal ownership; Capital links between companies; All changes, and date of the last update.	 Name of the owner; Month and Year of birth; Nationality; Owner identifier; Names of shareholder s; Country of residence of shareholder s / owners. 	 Type of insolvency proceeding; Time limit for lodging claims; Date of closing main insolvency proceedings; The court before which the decision opening insolvency proceedings is to be lodged; All changes (i.e. to individual companies and list of companies dissolved), and date of the last update

Company and company ownership Expected costs & benefits

ı	Expected costs	Ex	spected benefits
Infrastructural costs	 Costs related to infrastructural investments such as portals, APIs, Servers (could), etc. 	Increase in reuse benefits	Increase overall number of users
Data transformation	 Costs related to data processing including data cleaning, preparation of metadata, aggregation, anonymisation, etc. 	Increase economic benefits	 Companies' data hold significant economic value for reusers and constitute a considerable share of the information sector
Operational costs	 Costs related to data updates, replies to user requests, corrections of errors in the datasets, etc. 	Increase in AI & innovation	 Citizens' innovation, private sector and public sector innovation would all be fostered by the greater possibilities of reuse of these datasets
Other costs	 Any other costs such as legal advice on GDPR, training costs, etc. 	Increased social benefits	 Crime fight, public engagement and understanding, and government accountability
		Increased env. & climate change benefits	 Information contained in companies' accounts and reports can be used to analyse their environmental impact and sustainability outlook, giving consumers better information for choosing their products & services

Francesca Dechiara FBK

List of HVDs and their value

Datasets	Short description	Use Cases
Administrative Units	Units of administration, dividing areas where Member States have and/or exercise jurisdictional rights, for local, regional and national governance, separated by administrative boundaries. Land Administrative Units and Maritime Units are the basic units. Land Administrative Units are covering mostly land surface, while Maritime Units are covering territorial waters.	Mapping or use as statistical units, manage emergency rescue, waste management plans, protect water ecosystems, find responsible party for policy implementation and administration, forest management, subsidies for farmers, forecast agricultural production, spatial planning, monitoring of regional and urban policy implementation using territorial typologies based on administrative units, maritime spatial planning, integrated coastal management
Place Names	Geographical names or place names (or toponyms) are the proper nouns applied to topographical features and settled (and used) places and spaces on the earth's surface. Toponyms represent an important reference system used by individuals and societies throughout the world.	Emergency response Economic, social and environmental analysis Cultural identity and heritage Mapping and navigation Providing a link / index function to other spatial and aspatial data
Addresses	Location of properties based on address identifiers, usually by road name, house number, postal code. The basic unit of addressing is a building; a permanent construction, intended or used for the shelter of people, having at least one entrance from publicly-accessible space.	Geocoding of statistical surveys, manage emergency rescue, locate where people are, accessibility studies, manage incidents; locate economic activities in ecosystem accounting
Buildings	Geographical location of buildings. Constructions above and/or underground, intended or used for the shelter of humans, animals, things, the production of economic goods or the delivery of services that refer to any structure permanently constructed or erected on its site [from INSPIRE Data Specifications on Buildings].	Buildings are 3D topographic objects and, as such, may influence the propagation of physical phenomena. These data are required for serving citizens (e.g. school, hospital), assessments for air and noise pollution or risk assessments to various kinds of risks (earthquake, fire, flood etc.), monitoring of land consumption, population concentration and access to services.
Cadastral Parcels	Single areas of Earth surface (land and/or water), under homogeneous real property rights and unique ownership, real property rights and ownership being defined by national law.	Protect state lands, reduce land disputes, facilitate land reform, agriculture, land management, taxation, disaster management, real Estate Market, Taxation, LPIS (Agriculture), Land consolidation, Infrastructure Management, Spatial Planning, Protection of Soil and Water, Statistics

Expected costs & benefits

Cost components	Cost components description	Magnitude of costs (range)
Infrastructural costs	Establishment of the API and bulk download, adaptation of the IT infrastructure to real time provision	Initial investment (one time only) depending on the solution, in between 250,000 and 3,000,000 EUR.
		For further developments, depending on the country and the size, an example is the costs for data storage device: 450,000 EUR (once off)
Data transformation costs	Costs related to data processing including data cleaning, preparation of metadata, aggregation, anonymisation, etc.	In between 100,000 and 200,000 EUR (yearly)
Operational costs	Costs related to data updates, replies to user requests, corrections of errors in the datasets, etc.	In between 150,000 and 350,000 EUR (yearly)
(Lost) income for data supplier	(Share of) revenue related to the provision of the HVD	Depending on country. (e.g. Sweden:90mln SEK)
Other costs	Any other costs such as legal advice on GDPR, training costs, etc.	Not Available
Negative impact on competition	The estimated impact of competition distortion vis-à-vis private organisations active in the domain.	Not available

Study on the High Value Datase	Geometry of cadastral parcels; type of particle; particle code; references to the administrative area to which the particle belongs.	

Lower intensity intervention – Recommended measures

- Concerning **licences and terms of use**, the recommended licence for the lower intensity intervention is the Creative Commons Attribution 4.0 International - CC-BY 4.0. This recommended option will have no impact since this type of licences is widely used across Member States (MS). In the same time, this type of licence is also preferred by re-users.
- APIs and bulk download: Regarding the cadastral parcels the recommendation is to ensure at least access through WMS service as defined by INSPIRE, in read-only mode, due to the difficulties in the release of this dataset. The WMS remains a data product which allows the creation of new georeferenced data and the view of the geo-data as a whole. The WMS protocol provides feature information (as XML) by identifying a point on a map. For the other datasets, the download through API, bulk download, OGC services listed by INSPIRE should be guaranteed.
- When it comes to **formats**, an option for the publication of datasets is to follow INSPIRE requirements. According to the stakeholders' suggestions, the recommendation is to use Geopackage and GeoJSON, which are two relatively recent open and low-cost formats. GeoJSON is commonly used, the re-users have shown a strong preference for new open standards like Geopackage. Using these formats increases the machine-readability of the data. The proposal includes the use of dedicated services for automatic conversion is added.
- **Granularity:** concerning Addresses and Buildings datasets the recommendation is to guarantee at least a partial coverage (e.g. most populated cities). Based on our interviews, the findings already show a diversified situation across the MS and main issues are related to the data ownership at local level, the costs of management and the frequency of update that strongly affect the lack of a full national coverage. However, the full national coverage is recommended for the rest of the datasets. The level of scale to be guaranteed for the Buildings and Cadastral parcels is 1:5000 or beyond. The increase of detail in the level of scale corresponds to a raise in the costs of the dataset production.
- The **metadata** should match the INSPIRE requirements as the transformation to geoDCAT-AP can be done automatically from this basis. It is important that the data are also displayed in geoDCAT-AP in order to integrate them automatically into national open data portals.
- When it comes to **key attributes**, the values identified correspond to the common characteristics available across the majority of the Member States, for each type of dataset in scope. This is due to the implementation of the INSPIRE directive. Therefore, the impact on the organisations will remain rather low and limited. The interviewed stakeholders highlighted the relevance of having names in multiple languages as a key attribute, because it significantly improves the reuse. Regarding the Buildings dataset, entrances and floors are recommended in the list of the key attributes, as based on these elements it's possible to calculate the height of the building. The type of use could be generic and very basic. The recommended attributes for the Cadastral Parcels are the basic ones needed to release cadastral data with respect to the GDPR

Geospatial

Higher intensity intervention – Recommended measures

The main differences with the lower intensity intervention refer to the licence, the APIs and few changes on granularity and key attributes options for the datasets in scope:

- Concerning **licences and terms of use**, the recommendation is the use of CCO. According to our research, this type of licence is already adopted for the datasets in scope across several Member States. However, it continues to be not applied because it implies legal issues of compatibility and raises a lot of scepticism in terms of lack of attribution, and charging of responsibility.
- When it comes to the availability trough APIs and bulk download, the option for SPARQL Endpoint was initially considered for this higher-intensity policy option, but no longer available in this version. This would imply a more accurate implementation in the use of sharing vocabularies and metadata. This is already available in the Netherlands, for example. Also, the distribution and the download through APIs option is extended to the Cadastral Parcels.
- For **granularity**, the recommended level of scale is 1:5000 or beyond, for buildings and cadastral parcels datasets. In the case of Cadastral parcels, the range of the level of scale of the existing datasets varies from 1:10000 to 1:500. In most of the countries, the data is available at a scale of 1:2000. Concerning administrative units and place names, the scale depends on what needs be visualized.
- **Traceability:** The issues related to the interoperability between the geo-catalogues and open data catalogues can be solved by using the GEO-DCAT AP and DCAT-AP 1.0. However, the actual implementation of the open data catalogues encompasses the use of DCAT-AP 2.0, which results to be incompatible with the GEO-DCAT AP. This policy option should support a resolution of these challenges.
- **Key Attributes**: Concerning the Addresses in this intervention, the zip code is here added as a key attribute, although this information is privately owned in most of the cases and, could be significantly hard to obtain. Regarding the Buildings, the proposal of using dedicated services for automatic conversion is added. It is fundamental and very relevant in terms of value and reuse scenarios. This information is costly for data holders, if not collected from the beginning. Alternatively, the number of floors (levels) should be guaranteed. The type of use should be as detailed as possible. In this case, please see the INSPIRE recommendations, the information on the types of building are defined in their Annex III. The Cadastral Parcels' key attributes remain unchanged compared to the previous policy intervention.

Meteorological data Ton Zijlstra The Green Land

List of HVDs and their value

- Data holders and re-users see clear value chain for meteorological data
- Value created in large variety of sectors
- MS with open data policy show non-lineair increase in demand as well as benefits generally outweighing costs / new tax revenue outweighing costs by multiples.
- High friction comes from fees and mixed licensing (also in comparison with more uniform open US market)

Data sets
Observations data
Climate data (incl. validated observations)
Weather Alerts
Radar data
Numerical Weather Prediction model data

Expected costs and benefits

	Expected costs	Ex	pected benefits
Infrastructural costs	 Costs related to infrastructural investments, specifically APIs, are main concern, next to timely provisioning. 	Increase in reuse benefits	 Increase overall number of users, and volume per user. Removing fees leads to non-lineair jump in re-use, and new commercial entrants.
Data transformation	 Low costs expected related to data processing including data cleaning, preparation of metadata, aggregation, etc. unless uncommon file formats demanded 	Increase economic benefits	 Wide variety of sectors re-use data, Singular use cases can be bigger than total cost of transition. Over time new tax revenue bigger than costs of provisioning.
Operational costs	 Where third party cloud services are used, data volume and demand may mean increased marginal costs. 	Increase in AI & innovation	 Re-use outside traditional meteorological value added services will grow. Novel uses emerge based on real-time data (e.g. IoT), or less used variables.
Other costs	 Charging for data is a common practice (13 MS charge for observations data) Marginal costs models regularly lack transparency. 	Increased social benefits	 More consumer centric services, informing daily decisions (e.g. mobility, sports)
	Experience suggests compensating revenue loss from general budget.	Increased env. & climate change benefits	 Growing citizen science communities w.r.t. climate adaptation. Strong role in green energy (planning, and operations) Usage in agriculture to
© 2020		-	reduce water and pesticide usage and climate adaptation.

Lower intensity intervention

- High friction comes from fees, and dealing with loss of revenue is unavoidable even at low intensity interventions. 13
 MS currently charge for observations data.
- Observations are the starting point of the meteo-data value chain
- Timeliness, completeness & highest available temporal/geographic resolution determine re-use value
- Weather alerts are at core of the public task, already published as information
- Validated observations feed into the climate record, adding to
 digital structured historical climate data

Completeness	Update frequency and timeliness	Every 5-10 minutes in real time for automated stations, hourly unvalidated, for the last 24hrs	Validated hourly (or better temporal resolution) published at least daily and daily average observations data; structured historic data	As issued, or hourly
	Granularity	Per weather station, full temporal resolution	Per weather station, full temporal resolution	Alerts, 48hrs or more ahead
	Key attributes	All observation variables measured	All validated observation variables measured; daily averages per variable	

No specific recommendations for data linking, shared vocabularies, taxonomies, or traceability (except NWS or National open data portal w.r.t. alerts.)

^{*} Or other formats currently practiced in the field, using open standards

Higher intensity intervention

- Adds Radar data
- Adds Numerical Weather Prediction model data
- High volume, especially NWP ensemble data (depending on data format, and choice of parameters/levels)
- European Meteorological Infrastructure (EMI) might play a role for data provision
- Adds unstructured but digitised historical climate data (data transformation costs maybe involved)

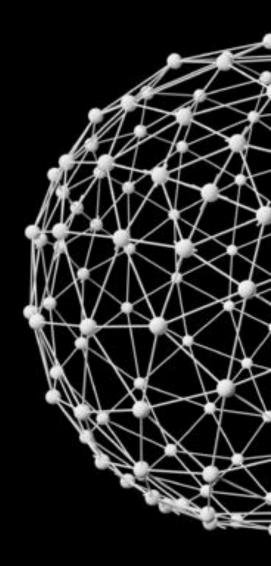

Observations data Climate data (incl. validated observations) Weather Alerts Radar data Numerical Weather Prediction model data

Ton Zijlstra
The Green Land

List of HVDs and their value

Earth Observation and Environmental extremely broad scope and fragmented (MS suggested hundreds of different datasets). Copernicus services depend on in-situ data from MS. Use cases broad across user groups and sectors, incl. public sector, but often hard to quantify (though many usage examples exist).

Main friction in fragmentation of data, diverse terms of use, fees.

All data within scope of INSPIRE and Environmental e-reporting priority data: adds open data requirement to INSPIRE / E-prio.

Earth observation	Environmental data	
Hydrography (I)	Air quality (prio)	Protected sites (I)
Land parcels (I), cover (II), use (III)	Biodiversity (prio)	Bio-geographical regions (III)
Elevation (II)	Emissions (prio)	Environmental monitoring facilities (III)
Geology (II)	Nature preservation (prio)	Habitats/Biotopes (III)
Ortho-imagery (II)	Noise (prio)	Natural Hazards (III)
Oceanography (III)	Waste (prio)	Soil (III)
Sea Regions (III)	Water (prio)	Species distribution (III)

Expected costs and benefits

Extremely broad scope (MS suggested hundreds of different datasets), assessing costs and benefits hard to quantify. Re-use benefits often based on combinations of data from various subthemes, measurement data e.g. needs administrative data to be useful. No real 'hierarchy' of use value to be made.

Expected costs		Ex	spected benefits
Infrastructural costs	 Costs related to infrastructural investments, specifically APIs, are main concern. 	Increase in reuse benefits	 Increased demand from citizens, research, businesses, and public sector. Removing friction in access to in-situ data very important to improve services e.g. Copernicus
Data transformation	 Low costs expected, compared to infrastructure, related to data processing including data cleaning, preparation of metadata, aggregation, etc. unless 	Increase economic benefits	 Wider variety of sectors re-use data, (EARSC identified 100+ products and services in 22 market sectors).
	significantly different from INSPIRE requirements. Collating data from dispersed sources also a cost, yet its own benefit too.	Increase in AI & innovation	 New services mixing EO/environmental data. European Data Portal now lists over 40 such new services. Novel uses w.r.t. execution of public tasks.
Operational costs	Rarely made explicit. Rising demand may increase bandwidth costs.	Increased benefits for public services	 Efficiency gains for public sector bodies, including data fees. Better public sector performance of PSB's other than dataholder.
Other costs	Charging for certain EO data is		-
	common, also between PSB's, with free data having re-use limitations applied. Experience suggests compensating revenue loss from general budget.	Increased social benefits	 Reporting obligations create demand w.r.t. transparency and public engagement.
	revende 1033 from general budget.	Increased env. & climate change benefits	 Growing citizen science communities. Strong role in energy, agriculture, environment management and climate adaptation.

Lower intensity intervention

Limits scope to Environmental e-reporting priority data including environmental measurements. Reporting obligations create their own re-use demand, but mostly re-use depends on combinations with other data now outside this scope.

Adds open data obligation to e-reporting priority data and Environmental monitoring facilities (III), removing non-commercial restrictions mostly.

Earth observation	Environmental data	
Hydrography (I)	Air quality (prio)	Protected sites (I)
Land parcels (I), cover (II), use (III)	Biodiversity (prio)	Bio-geographical regions (III)
Elevation (II)	Emissions (prio)	Environmental monitoring facilities (III)
Geology (II)	Nature preservation (prio)	Habitats/Biotopes (III)
Ortho-imagery (II)	Noise (prio)	Natural Hazards (III)
Oceanography (III)	Waste (prio)	Soil (III)
Sea Regions (III)	Water (prio)	Species distribution (III)

Lower intensity intervention Recommended measures

	Dimensions	E-reporting priority data and Environmental Monitoring Facilities	
Openness-data License (terms of use) specification		Creative Commons 0 or BY (or equivalent open license) No terms of use	
	Format	Cf. existing INSPIRE specifications	
	Machine-readability	Obligatory	
	Availability of API, bulk download	Both API and bulk download, as prescribed in e- reporting priority list	
Documentation	Metadata (dataset content description)	Complete (INSPIRE)	
	Documentation (incl. structure and semantics)	Complete and web-available (INSPIRE)	
Completeness	Update frequency and timeliness	As collected, for EMF highest collected temporal resolution	
	Granularity	Highest collected temporal and geographic solution	
	Key attributes	All attributes mentioned in e-reporting priority data list and EMF locations, parameters measured and complete observations data	

Higher intensity intervention

Includes Environmental e-reporting priority data, and covers the listed INSPIRE themes in full. Adds open data requirements to INSPIRE (download) services. Allows the combinations found across varied use cases.

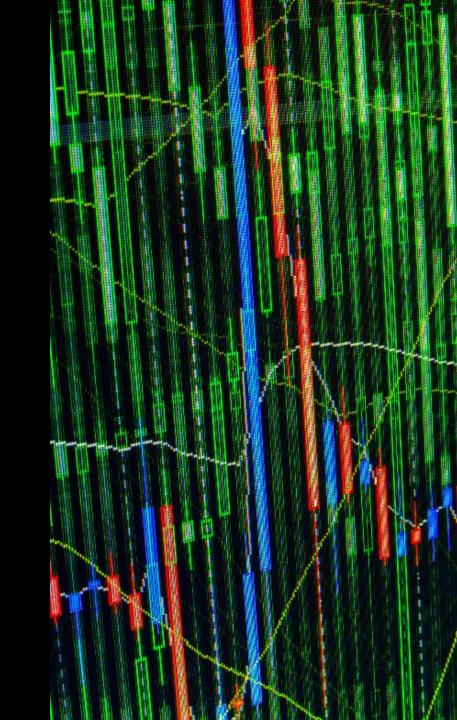

Removes restrictive terms of use and fees. INSPIRE's data harmonisation efforts extend to open data. Follows current/future INSPIRE standards.

Earth observation	Environmental data

Cristina Moise The Lisbon Council

List of HVDs and their value

Official statistics become high-value datasets based on their use - who needs them and why, how and where are they applied. In general, stakeholders and re-users agree that **all official statistics** should be considered high-value datasets. Due to the broad selection of datasets within the official statistics, and considering the inputs received from stakeholders, we propose a short list of datasets as potential high-value datasets covering social, macro-economic and business statistics.

Social statistics reflects the countries' population social conditions through the perspective of demography, labour market, poverty and inequality and health aspects. **Demography** concentrate on the overall structure and trend of population development. It information information on *population*, and vital statistics - *births* (including *fertility rates*) and *deaths* (including *mortality rates*) statistics. **Labour market data** provide another set of information about of the socio-economic environment within a country. It helps identifying economic needs and niches of opportunities, and reflects the labour market dynamism via *employment* and *unemployment* rates, *job vacancies* and *labour force potential*, pointing out to both hotspots for development and structural issues within economies. **Poverty** and **inequality** data reflects the population social struggle and overall well-being. Material and social deprivation, at-risk-of-poverty and low work intensity households are important aspects of societal development of countries. An aging population needs better healthcare services. Thus, health data and, in particular, current healthcare expenditure provide relevant information on costs, general services and providers at countries' level.

Macro-economic statistics provides relevant information about the countries' development trend with the help of national accounts, price statistics and government finances datasets. The economy performance of a country is reflected in the **national accounts** data through GDP and main aggregates, key indicators on corporations and key indicators on households statistics. **Price statistics** brings in addition information about the economic stability. The transparency and accountability of the public spending is an important aspect of a country's economy. **Government finances data** provides information on efficiency and effectiveness use of public money, and help identify the government spending patterns.

Business statistics often covers the business sector's economic performance, reflected by data about short-term business statistics, trade and tourism. Business communities are an essential components of the countries' economic development, and **short-term business data** and **trade data** provide the relevant information to monitor their competitiveness and performance. In some of the Member States, the **tourism flows** constitute an important share of economy.

Expected costs and benefits

Expected costs

- It is difficult to identify specific costs for particular datasets as in most cases it is part of the regular activity of the organization
- Infrastructural costs (related to portals, APIs, Servers (could), etc.) depend significantly on the current IT development structure and country size. Often such an overall estimate will include both on-time investments (e.g. development and implementation of a solution), and yearly maintenance costs of the infrastructure itself. Exact values were difficult to gather.
- Data transformation costs (related to data processing including data cleaning, preparation of metadata, aggregation, anonymisation, etc.) are also part of current activities of an NSI, and often there are no breakdowns by datasets or parts of them.
- Operational costs (related to data updates, replies to user requests, corrections of errors in the datasets, etc.) are another category that is part of the day-by-day of the NSIs, and a breakdown by specific costs was difficult to provide.
- Other costs (related to legal advice on GDPR, training costs, etc.) were also difficult to quantify

Expected benefits

- Statistics have different types of users: media and general public, international policies and organisations, decision makers, analysts, non-governmental organisations (NGOs), the civil society, producers of statistics and the scientific community and researchers.
- Better outcomes from the decision makers (public sector, business sector or individuals) by making use of highquality information to perform their function.
- Increase in transparency and improvement of the accountability of public and other bodies from the citizens side
- Better understanding of the society by providing relevant information while respecting the rights of people, at the same time
- Enabling new research and analysis on the basis of a comprehensive evidence-base, leading to innovation and improved economic and social outcomes.

General context and datasets overview

As part of the European Statistical System, the statistics are both standardised and harmonised across Member States.

Also, the datasets in scope are freely available in all Member States.

Category	Sub-category	Datasets, key variables and breakdowns
Social	Demography	The datasets in scope are population , fertility , mortality , births and deaths .
statistics		Key variables are population, births and deaths, life expectancy, crude rates for births and for deaths (including infant mortality), fertility rates (total, by mother's age), median age, old age dependency.
	Labour market	The datasets in scope are employment, unemployment and potential labour force.
		Key variables are employment and unemployment rate, types of employment (full-time, part-time, self-employed, temporary), duration of unemployment (including long-term unemployment), job vacancies, persons looking for jobs.
	Poverty and	The datasets in scope are poverty and inequality .
inequality		Key variables are people at-risk of poverty and social exclusion, severe material deprivation, material and social deprivation, households with low work intensity, income quintile, Gini coefficient of equivalised disposable income.
	Heath statistics	The dataset in scope is current health expenditure.
		Key variable is the current health expenditure.
Macro- economic	National accounts	The datasets in scope are GDP and main aggregates, key indicators on corporations and key indicators on households.
		Key variables include gross domestic product at market prices, gross value-added, final consumption expenditure of households, exports and imports, taxes and subsidies, gross capital formation (total and non-financial corporations, households), gross operating surplus and mixed income of non-financial corporations, financial sector assets and liabilities, compensation of employees, households sector assets and liabilities employment, disposable income and savings of households, gross national income, net lending/borrowing (total economy, financial and non-financial corporations, households).

List of HVDs and their value

Category	Sub-category	Datasets, key variables and breakdowns
Macro-	Price statistics	The dataset in scope is Harmonised Index of Consumer Prices (HICP).
economic		Key variables are HICP monthly index and rate of change (monthly and annually), HICP annual (rate of change).
	Government	The datasets in scope are government expenditure and revenue and consolidated government gross dept.
	finances	Key variables are general government revenue, expenditure, net lending/borrowing of the general government, government gross debt.
Business	Short-term	The datasets in scope are industrial production, industrial producer price index and production in construction.
statistics	business statistics	Key variables are industrial production index, industrial producers price index, domestic and non-domestic producers price indexes (euro and non-euro areas), production in construction index.
	Trade statistics	The datasets in scope are retail trade volume and EU international trade in goods (imports and exports).
		Key variables are nights spent at tourist accommodation establishments, participation in tourism, tourism trips and expenditure made by EU residents, tourism nights spent by EU residents.
	Tourism	The dataset in scope is tourism flows in Europe.
	statistics	Key variables are retail trade volume index, statistical values, net mass and supplementary quantity of international trade.

The policy options will focus more on the measures for publication rather than the number of data fields and/or datasets to be included as high-value datasets.

Lower intensity intervention

	Description	Demography, labour market, GDP, government finances, business statistics, social statistics			
	Licence and terms of use	CC-BY 4.0			
iness	Format	CSV, XML (SDMX), JSON			
Openness	Machine-readability	Mandatory			
	Availability of API, bulk download	Simple structured APIs and partial bulk download available			
no	Metadata (dataset content description)	Simple structured file (e.g. using official statistics baseline standard to provide basic information only)			
Documentation	Documentation (incl. structure and semantics)	Complete and web available			
ocur	Data linking	N/A			
	Shared vocabularies/taxonomies	N/A			

- The impact on the data holders' organisations is considered to remain **low**, as many of the recommendation are already available in the Member States
- The formats proposed are already commonly used by Member States (CSV in 22 out of 27 countries, XML/SDMX in 15, JSON in 10). Often, more than one format is provided
- The main cost driver is the development of APIs, which will mostly impact the countries that do not provide them already (12 Member States)

High intensity intervention

	Description	Demography, labour market, GDP, government finances, business statistics, social statistics
10	Licence and terms of use	CC BY 4.0
Openness	Format	CSV, XML (SDMX), JSON
enr	Machine-readability	Available
O	Availability of API, bulk download	Complex APIs (including customised clients) and bulk download available
Documentation	Metadata (dataset content description)	Well-developed structured file (i.e. description of the statistical data, as well as descriptions of the statistical concepts, methodologies and information on data quality)
ıment	Documentation (incl. structure and semantics)	Complete and web available
סכו	Data linking	Recommended, but not mandatory
	Shared vocabularies/taxonomies	Controlled vocabularies and taxonomies DCAT-compatible

- The impact on the data holders' organisations is assumed on the **medium to high**, based on their current development
- Main cost drivers in terms of development and maintenance:
 - Shared vocabulary / taxonomies important for integration with existing statistical data portals and expanding the use and re-use of the datasets (medium)
 - Data linking facilitate to connect information from different sources, increasing the level of discoverability and re-use of the datasets; is cost intensive (high impact);
 - APIs remain an important cost driver as application with higher complexity might result in an increase impact on the organisations (medium to high)

MobilityLaura Doumbouya *Deloitte*

Datasets in scope

The existing regulatory acquis covers a wide range of datasets pertaining to the "mobility" thematic area. Certain datasets covered by EU legislation were out of scope of this study due to ongoing EU-level policy developments and/or due to the existence of restricted access regimes.

Out of scope:

- Due to ongoing policy developments:
 - ➤ Datasets covered by the Intelligent Transport Systems (ITS) Directive including
 - the Rail Interoperability Directive
 - the Vessel Traffic Monitoring and Information Systems (VTMIS) Directive
- Due to restricted access regimes:
 - ➤ Datasets covered by the Regulation on air traffic management (ATM) and air navigation services (ANS)

In scope:

- Transport networks datasets, including those identified under the INSPIRE data theme:
 - > Common transport networks elements
 - Road, rail, water, air and cableways transport networks
- Inland waterway and river infrastructure data identified under the River Information Services (RIS) Directive and its implementing legislation
 - Static, urgent/dynamic infrastructure data and electronic navigational charts

Expected costs & benefits

Expected costs

INLAND WATERWAYS

- Current modalities for the provision of inland waterway infrastructure data across the EU are fairly aligned with the to be recommendations
- Full harmonisation will be undertaken in the context of the CEF funded VisuRIS COMEX

TRANSPORT NETWORKS

- Currently, these datasets are generally available free of charge, in a harmonised format and provided through large scale IT infrastructure.
- The establishment of APIs and the updates of the datasets will be the main cost drivers.

Expected benefits

Complementing existing efforts in promoting the reuse of such data through the obligation of providing these for free, in harmonised and machine readable formats and both through bulk download and APIs.

Complementing the RIS Directive which does not define a harmonised format, availability of API/bulk-download, timeliness of the data, etc.

Complementing the INSPIRE Directive by adding an 'Open Data' layer to its provisions, including the availability of APIs.

Data Intelligence Offensive - Austria

Peter A. Bruck Secretary General

"PSI High Value Datasets webinar" 4. Sept 2020 DIO – Austria

DIO is based on the following insights:

- Data sharing and exchange are key in order to generate value and strengthen EU
- Functioning data markets are the essential prerequisite for data to be used as a strategic resource for innovation and value creation.
- The value added by data analytics, artificial intelligence, and machine learning is significantly increased by efficient data trading.
- High Value Data sets collected by one organisation/institution/enterprise need combined with other data and traded.
- The use, value creation and increase in competitiveness depend largely on the scope and quality of the available data.

Success factors for HVD sharing and trading are:

- Trust and ethics
- Security and data sovereignty
- Data quality and interoperability
- Technologies and innovation
- A strong future through community

DIO view on key issues which need to be addressed

- Lack of trusted and secure platforms for sharing personal and industrial data
- Lack of privacy-aware analytics methods for secure sharing of personal data and industrial data
- Lack of ICT and Data skills seriously limits the capacity of Europe to respond to the digitization challenge
- Insufficient involvement of SMEs and lack of access to data and technology
- IT standardization faces new challenges as technologies converge and federated systems arise, creating new gaps in interoperability
- Advance the state of the art w.r.t. scalability, computational efficiency of methods
- Analysis and address privacy/confidentiality threat models
- incentive models for the sharing of data assets, incl. high value data sets

Definition of High Value datasets and resulting GDPR concerns

- Current process: Implementing act to further specify Annex I of the directive (EU) 2019/1024 legislative procedure
- Opening clause in GDPR Article 86, Recital 154 is applicable
- Personal data in documents.... should be able to be publicly disclosed...if the disclosure is provided for by Union or Member State law.
- Such laws should reconcile public access to official documents and the reuse of public sector information with the right to the protection of personal data and may therefore provide for the necessary reconciliation with the right to the protection of personal data pursuant to this Regulation.

PSI Alliance*

High Value datasets and "normal PSI datasets"

- Current process according to Article 14: Commission lays down a list of specific high-value datasets..... among the documents to which this Directive applies
- = Directive applies to all the datasets mentioned in the workshops
- Member states are obliged to release all those documents, not just the HVDs
- Even API, charging and machine readable format are requested in softer provisions
- Definition of HVDs dos not mean release yes/no, but which way to release

Comments on High Value Datasets

- Include **all businesses and business information** (eg sole traders, company directors, managers, Ultimate Beneficial Owners...) and not only registered companies
- Include all information that is made available through any type of business register
- Use as a basis for common data layer facilitating the roll out of sectoral data spaces, so it should be set on maximum data availability and not minimum
- Open data and no restrictive license nor terms of use or unjustified database rights

Comments on High Value Datasets

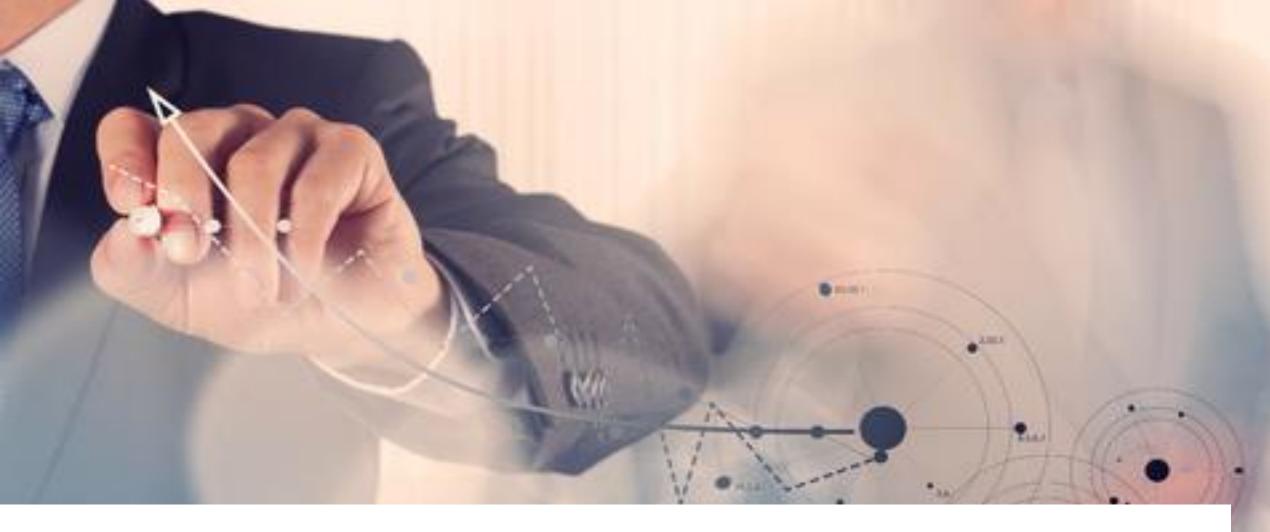

- Use of business information in assessing and managing **TRADE CREDIT** benefits the whole economy, especially in economic turmoil times
- It is essential to have **updated information** in getting **creditworthiness assessments** which help prevent business failures
- Increase CORPORATE TRANSPARENCY and AML or FRAUD detection by leveraging data
- Ensuring the **legitimate right to information** in business context prevails

Lunch break

4. Presentation of the study results – Part II

Eike-Christian Koring Deloitte

Assumptions made by relevant literature

- Our impact modelling assumptions are based on relevant literature and the findings of our study research so far. However, several studies such as the latest study by the European Commission (2020) on the economic impact of open data point out that the exact reuse of open data and in particular PSI Data is barely documented. In addition, reuse can be endless and network effects can even multiply the economic value.
- The market size of PSI data is therefore defined as the market size of products, services, and content improved or enabled by PSI Data. However, which share of this value is attributed to open data can only be estimated.
- In order to determine the market value of PSI, the Vickery 2011 study provided a main base for the prediction of the direct impact.

Study	Context	Assumptions about data economy/ open data
Recent Studies on PSI	Directive. Looks at the impact of the adoption of the PSI Directive in 2006, extrapolates sectoral + national	Predicts a direct economic benefit of open data of 40 bio. EUR in the EU Predicts an indirect economic benefit of 140 bio. EUR in the EU. Predicts socio-economic benefits of 40 bio. EUR in the EU. Predicts EU market for government data in 2010 at about 32 bio. EUR.
McKinsey 2013, Open Data	Large scale report about the economic potential of data and open data with macro-economic estimates.	Estimates the total economic potential in the EU at 900 bio. Dollar, applying a bottom-up approach.
EU 2015 , Creating Value through open data	Macro-economic research into economic potential in the EU for 2016-20, building on Vickery 2011.	Predicts a direct economic value of open data of 75.7 bio. EUR in 2020. Predicts public sector savings in the EU of 1.7 bio. In 2020. Predicts an indirect value of open data in the EU from 265-286 bio. EUR in 2020.
EU 2017 , Open Data Maturity in Europe	Yearly EU Data Portal Study	Predicted 325 bio. EUR of potential contribution of open data for 2016-2020 with 30.000 new jobs created in 2020.
Deloitte 2018 , Reuse of Public Sector Information	Directive, whether it still responds to the stakeholders'	Study based on the Vickery Study 2011 and assumptions of Eurostat and the Data Monitoring Tool. Assessment identified problem areas of re-use of PSI Data, among them costs of data re-use, availability, exclusive agreements

Our method: Top-down approach

- The Economic Impact of HVDs (it's contribution to GDP) is estimated based on a top-down approach.
- The baseline has been calculated based on the extrapolation of the Vickery 2011 study and the forecasts of the European Data Market Monitoring Tool. The monitoring tool provides three forecast scenarios at the 2025 Horizon: a baseline scenario, a challenge scenario and a high growth scenario. The baseline scenario was chosen as the relevant scenario.
- In the year 2020, the outbreak of Covid-19 massively affected the European economy. Expected figures have been corrected to take into account the impact of this crisis.

Determination of baseline

Share attributable to HVD

Impact of Policy Options

First step

Estimate the value of the relevant economy (to be addressed) for the baseline. The **share in GDP/GVA** will be used as **main measurement indicator** in this regard.

Second step

Secondary sources and studies including e.g. the **EU Data**Market Study and Vickery

2011 provide a baseline for the Economic Value of the Data Economy and relates it to the GDP.

We will use this data as a baseline.

Third step

The **economic impact** of the different **policy options/packages (on GDP)** will be measured for each indicator on an incremental basis (vs. the baseline).

Our method: Top-down approach

Determination of baseline

- Based on results of the studies e.g. EU Estimating the share attributable to
- Taking into account results of secondary studies and findings in D2/D3/D4.

Data Market Study / Vickery.

 Extending the forecast to 2028 (2023) + 5 years).

Share attributable to HVD

- HVD.
- Based on secondary sources and preliminary results the value attributable to HVD is estimated.

Impact of Policy Options

- Based on the preliminary findings and results in the **six HVD domains**, the economic impact for the policy options is estimated.
- The result is presented as incremental impact on the Economic Value / share in GDP.

Baseline scenario PSI growth: Estimated market size of the PSI sector based on Vickery 2011. Growth estimations until 2020 according to predictions of the EU Data Monitoring Tool.

Assumptions from 2021 onwards: baseline growth rate of 6,5% in the PSI sector according to relevant literature and findings in previous deliverables. From 2026, the PSI market size is estimated to follow the growth path in line with the OECD estimates.

Macroeconomic impact assessment – Baseline Scenario

Market shares (% of PSI market) and direct impact of the six thematic areas

Based on existing literature and on the study research so far, we estimated the market share of the six thematic areas in % of the PSI Market for the baseline scenario.

Consequently, we could estimate the **direct impact in Mio. EUR of each thematic sector for the years 2023-2028**.

Economic impact assessment – Policy interventions Growth rates for lower and higher intervention option (1/2)

Assumptions on growth rates for lower and higher intervention option for the thematic areas company for 2023-2028.

- In **company and company ownership**, the lower intensity intervention option includes only two datasets in scope which would be, as described in the specific section above, the low-hanging fruits as the implementation would require little effort from member states. Hence, only a slight change of the growth rate in comparison to the baseline is expected and therefore a growth rate of 7.0% for the lower intensity intervention option was assigned. The higher intensity intervention option would include a wide scope of datasets and consequently a medium to major change of the growth rate in comparison to the baseline. Considering that the company and company ownership high value data set market is relatively small, a growth rate of 8.5% was assumed.
- For the lower intervention option for **geospatial** high value data, only limited requirements of data will be necessary which requires only minimum changes in the current options. 4-5 high value datasets will be in scope with this option. It can be concluded that this intervention option would result in a slight to medium change in the growth rate of the geospatial sector, also because of the importance of geospatial data and its expected impact to affected stakeholders. Taking this into account, a growth rate of 7.5 % for the lower intervention option of geospatial high value data was assumed. The higher intervention option is the far-reaching option, whereas the main differences to the lower intensity option refer to the licence, the APIs and few changes on the granularity and key attributes. Considering this medium change in comparison to the baseline, a growth rate of 8.5% was attributed to the higher intensity intervention option.
- The **meteorological** lower intensity intervention option encompasses three datasets, namely observations, climate and digitised structured historical climate data. This intervention stays close to what is already common, but leaves room for Member States to adopt more advanced technology. Hence, this intervention option would go along with a medium change of the growth rate in comparison to the baseline. A growth rate of 8.0% was therefore attributed to the lower intensity intervention option of meteorological high value data. In the meteorological higher intensity option, three additions are made, unstructured historical data, radar data and numerical weather prediction model data. As all data sets are highly voluminous, this intervention option can be considered as a major change in the growth rate in comparison to the baseline. Therefore, a growth rate of 9.5% was attributed to the higher intervention option of meteorological datasets.

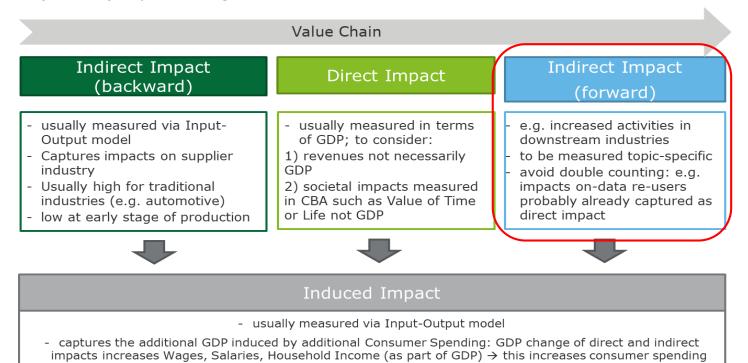

Economic impact assessment – Policy interventions Growth rates for lower and higher intervention option (2/2)

Assumptions on growth rates for lower and higher intervention option for the thematic areas company for 2023-2028.

- The lower intensity intervention option of **earth environment and observation** includes an open data obligation to the environmental reporting and observation data which means mostly removing reuse restrictions. This constitutes an expected medium change of the growth rate in comparison to the baseline, for which a growth rate of 8.0% was assigned. The higher intensity intervention option involves that the scope of data involved is broadened by adding additional INSPIRE themes relevant to earth and observation. This intervention option implies a medium to major change in comparison to the baseline. A growth rate for the higher intensity intervention option of 9.0% was therefore assigned.
- For **statistics**, the lower intensity intervention option requires only a set of minimum changes to the current publication options available which is expected to have low to no impact on the institutions and stakeholders affected. Hence, no to slight changes of the growth rate of statistics in comparison to the baseline is expected for the lower intensity intervention option. Therefore, a growth rate of 7.0% for the lower intensity intervention option for statistics was assumed. The higher intensity intervention option implies new changes in terms of measures for publication. Improved APIs and metadata files, development of controlled vocabularies and taxonomies are expected which therefore constitutes a medium change in comparison to the baseline, also because the market of high value data in statistics is already quite advanced relative to the other thematic areas. A growth rate of 8.0% for the higher intensity intervention option in statistics is consequently assumed.
- For **mobility**, the lower intervention option covers, as stated in chapter 3.1, only the bare minimum of the datasets and 2 out of 4 categories. This signifies a slight to medium change of the growth rate in comparison to the baseline. A growth rate for this slight to medium change of 7.5% was therefore assigned for the lower intervention option of mobility. The higher intervention option, in contrast, is more ambitious than the previous one as all four categories of datasets are included in the high value data list. Hence, this can be interpreted as a medium change in the growth rate in comparison to the baseline and therefore a growth rate of 8.0% for the higher intervention option in mobility was assigned.

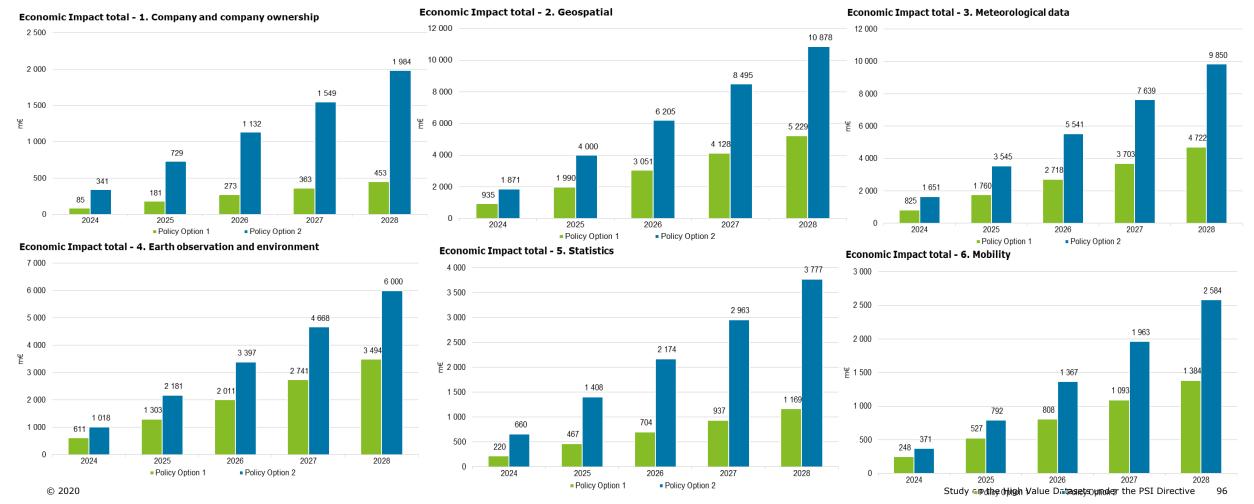

General methodology and indicators: Multipliers to measure indirect and induced impacts

- In order to fully reflect on the overall impact on the economy, indirect/induced impacts can been calculated based on the estimates of the direct impacts.
- The analysis focuses on the indirect (forward) impact on downstream industries, which is considered to be the major indirect impact.
- To measure these impacts with regard to the PSI/HVD economic activity, results of the EU Data Monitoring have been analyzed. As a result, for the indirect (forward) impact a magnitude between ca. 2.5 and 3.0 has been identified.

Preliminary results – total impact by policy option

Based on our top down-approach, the calculations yield the following results for the total impact by thematic area and policy option for the years 2024-2028:

Comparison of policy optionsEike-Christian Koring Deloitte

Ranking the three intervention options with four assessment criteria

We used the MCA for two reasons:

First, it is an alternative to the Cost-Benefit Analyses (CBA) performed in the previous phases.

Second, it is particularly **relevant** at the following stages of our **Impact Modelling**:

- At the stage of **assessing the economic, social and environmental dimensions** of each of the three intervention options, including possible trade-offs between these dimensions
- At the stage of comparing the policy options: against the main criteria of Effectiveness,
 Efficiency and Coherence as well as Proportionality and Feasibility.

Explanation of the criteria

Effectiveness	Effectiveness looks	at the extent to which	ı different options wou	uld achieve the

objectives of the intervention, looking for evidence of why, whether or how

these changes are linked to the intervention.

Efficiency Efficiency is defined at the costs and benefits of a policy option as they accrue

to different stakeholders.

Coherence The coherence of each option with the overarching objectives of EU policies,

both internally and with other EU interventions.

Proportionality EU action should be relevant and necessary and should offer value beyond what

Member State action alone can deliver and not go further than is necessary to

resolve the problem or meet the policy objective.

Feasibility The options should respect the principle of conferral (legal feasibility). They

should also respect any obligation arising from the EU Treaties (and relevant international agreements) and ensure respect of fundamental rights. Options that

would clearly fail to garner the necessary political support for legislative adoption

and/or implementation could also be discarded (political feasibility).

Multi-Criteria Analysis (MCA) Our non-compensatory approach

In our **input matrix** we used five criteria with different weighing which aims to reflect the reality of the importance of the different criteria.

Assessment criterion	Weight	Direction	Performance value
Effectiveness	0.30	1	Qualitative: -3 / +3
Efficiency	0.20	1	Qualitative: -3 / +3
Coherence	0.10	1	Qualitative: -3 / +3
Proportionality	0.10	1	Qualitative: -3 / +3
Feasibility	0.30	1	Qualitative: -3 / +3

Our non-compensatory approach – Step 1: Weighted Performance

The weightings, direction and performance of the three intervention options was then determined separately by PSI-sector for each of the four criteria. The importance of the criteria is reflected in the respective weights.

	Input mate	rix		Policy Options 1. Company and company ownership					
Criteria	Weight Direction		Performance value	P1 (lower inten	sity intervention)	P2 (higher intensity intervention)			
				Performance	Weighted performance	Performance	Weighted performance		
Effectiveness	0,30	1	-3/3	1,50	0,45	2,50	0,75		
Efficiency (B/C-ratio)	0,20	1	Benefit-/Cost-ratio or Score -3 / + 3	2,50	0,50	1,50	0,30		
Coherence of the policy options	0,10	1	-3/3	2,00	0,20	2,50	0,25

Our non-compensatory approach – Step 2 and 3: Outranking and Permutation Matrix

We prepared an "outranking matrix": Options are compared pairwise. For each comparison, all weights are summed for the criteria where Option A is favoured over Option B as indicated by the weighted performance of each criterion.

The policy options were subsequently ranked in 2! (=2) different ways but the aim is to find the permutation with the maximum likelihood score. Hence, the optimal ranking is one with the maximum likelihood score.

Policy ranking permutation					
Rank #	Policy ranking	g permutation	Policy pairings	Coefficients of policy pairings	s Final score
1. Company and company ownership					
1	P1	P2	P1-P2	0,60	0,60
2	P2	P1	P2-P1	0,40	0,40
2. Geospatial					
1	P1	P2	P1-P2	0,60	0,60
2	P2	P1	P2-P1	0,40	0,40
3. Meteorological data					
2	P1	P2	P1-P2	0,20	0,20
1	P2	P1	P2-P1	0,40	0,40
4. Earth observation and environment					
2	P1	P2	P1-P2	0,30	0,30
1	P2	P1	P2-P1	0,40	0,40
5. Statistics					
2	P1	P2	P1-P2	0,30	0,30
1	P2	P1	P2-P1	0,60	0,60
6. Mobility					
1	P1	P2	P1-P2	0,50	0,50
2	P2	P1	P2-P1	0,30	0,30

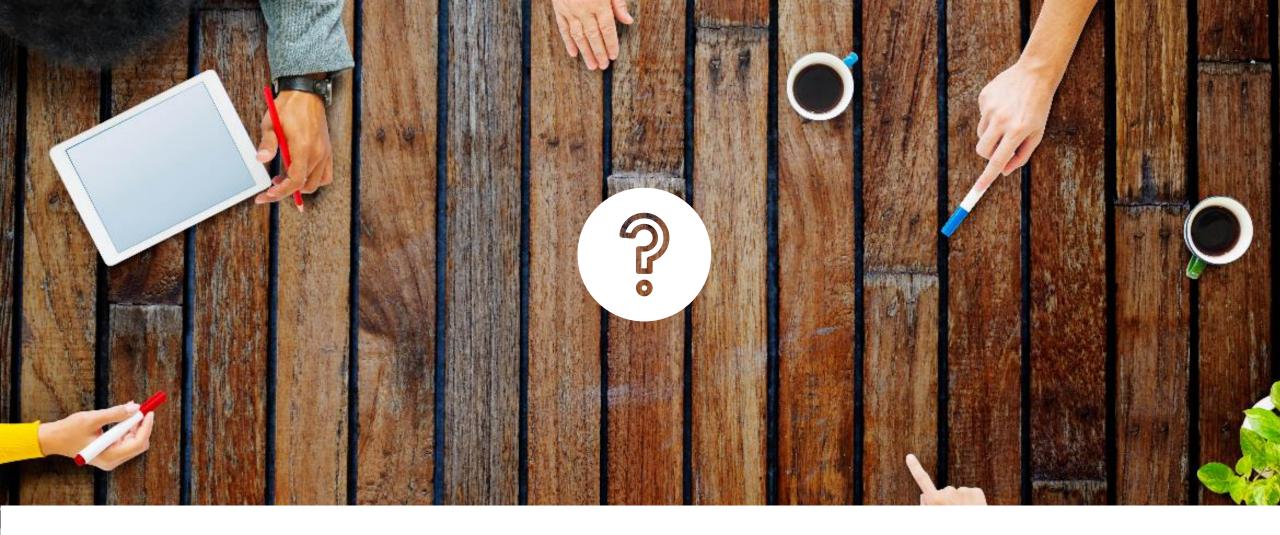

Policy ranking permutation with the final scores (maximum *likelihood score*) per PSI sector

Multi-Criteria Analysis (MCA) Results and Conclusions

As a result, **Policy Option 1 (lower intensity intervention)** is identified as preferred option in the thematic areas of Company & Company Ownership, Geospatial data and Mobility.

Policy Option 2 (higher intensity intervention) is the preferred option in the thematic areas Meteorological Data, Earth Observation & Environment and Statistics.

	Preferred PO (Equal Weight 0.20)
Company & Company Ownership	PO1
Geospatial Data	PO1
Meteorological Data	PO2
Earth Observation & Environment	PO2
Statistics	PO2
Mobility	PO1

Riitta Autere *Ministerial Advisor – Public Sector ICT*

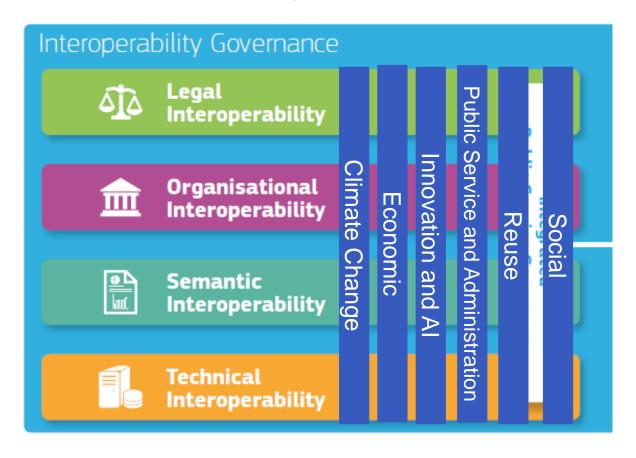

The European Interoperability Framework (EIF) as a common adoptation tool for PSI HVDS

Riitta Autere, Ministerial Adviser & Olli-Pekka Rissanen, Chief Specialist 4.9.2020 PSI High Value Datasets webinar

The EIF Conceptual Model with PSI HVDS value framework's characteristics

The revised EIF Conceptual Model

- The European Interoperability
 Framework (EIF), part of
 the Communication (COM(2017)134)
 from the European Commission
 adopted on 23 March 2017.
- The framework gives specific guidance on how to set up interoperable digital public services.
- https://ec.europa.eu/isa2/eif_en

Why the EIF?

Underlying principle 1: subsidiarity and proportionality

Underlying principle 2: openness

Underlying principle 3: transparency

Underlying principle 4: reusability

Underlying principle 5: technological neutrality and data portability

Underlying principle 6: user-centricity

Underlying principle 7: inclusion and accessibility

Underlying principle 8: security and privacy

Underlying principle 9: multilingualism

Underlying principle 10: administrative simplification

Underlying principle 11: preservation of information

Underlying principle 12: assessment of effectiveness and efficiency

Some of the recommenattions relevant for the PSI HVDS adoptation:

- Rec. 2: Publish the data you own as open data unless certain restrictions apply.
- Rec. 4: Give preference to open specifiations, taking due account of the coverage of functional needs, maturity, and market support and innovation.
- Rec. 6 & 7: Reuse and share solutions ... and Reuse and share information and data...
- Rec. 12: Put in place mechanisms to involve users in analysis, design, assessment and further development of European public services.
- Rec. 16: Use information systems and technical architecture that care for multilingalism...
- Rec. 23: Use a structured, transparent, objective and common approach to assessing and selecting standards and specifications. ...

Not see the wood for the trees? Could the EIF help us?

Deloitte.

Deloitte.

Deloitte refers to one or more of Deloitte Touche Tohmatsu Limited ("DTTL"), its global network of member firms, and their related entities. DTTL (also referred to as "Deloitte Global") and each of its member firms are legally separate and independent entities. DTTL does not provide services to clients. Please see www.deloitte.com/about to learn more.

Deloitte is a leading global provider of audit and assurance, consulting, financial advisory, risk advisory, tax and related services. Our network of member firms in more than 150 countries and territories serves four out of five Fortune Global 500® companies. Learn how Deloitte's approximately 286,000 people make an impact that matters at www.deloitte.com.
