380 NM² MBES

AMC Search & Fugro CatA Programme MoU

Australian Maritime College and Fugro are working towards an CatA Program.

Expected to launch in Q1 2025 and open to people already in the industry or those wanting to commence a career in Hydrographic Survey.

To express interest in the program, please email

UN Ocean Decade of Ocean Science

2021
2030 United Nations Decade
of Ocean Science
for Sustainable Development

The connection between SDGs & Fugro's goals:

To support...

Communities

Understand the impact of fast and slow onset hazards

Infrastructure

Ensure safe and resilient coastal infrastructure

Nature

Enhance the management and monetisation of natural capital

... to plan, monitor and act for coastal hazard preparedness

Land and marine spatial Geo-data acquisition

Satellite remote sensing technologies
Bathymetry, topography

Marine surveys
Hydrographic/oceanographic properties

Airborne LiDAR surveys
Bathymetry, topography, 3D buildings and assets

Sea'ties Regional Workshop July 2023

ADAPTING COASTAL CITIES AND TERRITORIES TO SEA LEVEL RISE IN THE PACIFIC Challenges and Leading Practices

Fugro: Developing digital tools to support climate adaptation planning in the Pacific

Fugro is a world-leading Geo-data company with a vision to co-design digital solutions for coastal communities and decision-makers globally, empowering them to improve coastal adaptation management via data-driven insights. LiDAR (Light Detection and Ranging) is commonly used to measure both topographically and bathymetrically across the coastal interface. Creating a high-resolution (cm-scale), full-coverage, three-dimensional representation of coastal infrastructure, vegetation, ground elevation and water depths, as well as vitally supporting higher fidelity hydrodynamic coastal modelling. Authorities can use such information for different applications, such as urban planning and risk assessment from climate-induced hazards, including sea level rise and floods to a much higher degree of accuracy, reducing uncertainty and improving the quality of decision making. The 3D visualisation of the LiDAR data enables easy communication of the risks to ensure political and coastal community engagement and awareness. One success story in the Pacific region is the use of Fugro's LiDAR data in Tuvalu's Coastal Adaptation Plan (TCAP). With this data set, numerous products were derived by The Pacific Community (SPC). These products include: a Digital Elevation Model (bathymetry and topography), inundation models for different climate projections, shoreline change over time and risks on different assets. These valuable products pushed the boundaries regarding precision, beyond what can be done with open-access data, or observations at specific points in space. Such a solution can be rolled out across the Pacific with the acquisition of LiDAR and other remote sensing datasets.

Exploring your challenges together

Voyage is a toolkit of workshops and rapid prototyping methods that can be applied to explore potential future scenarios and enable discovery of digital solutions to meet your needs

Voyage co-creation process

Understand your
Geo-data challenges

Map your needs
through discovery
workshop

Explore solution
possibilities with
our experts

Rapidly test ideas
through VirGeo®
Lab

Deliver tailored
solution to meet
your needs

1.5 hours to 1 day workshop

1 week to 2 months prototyping

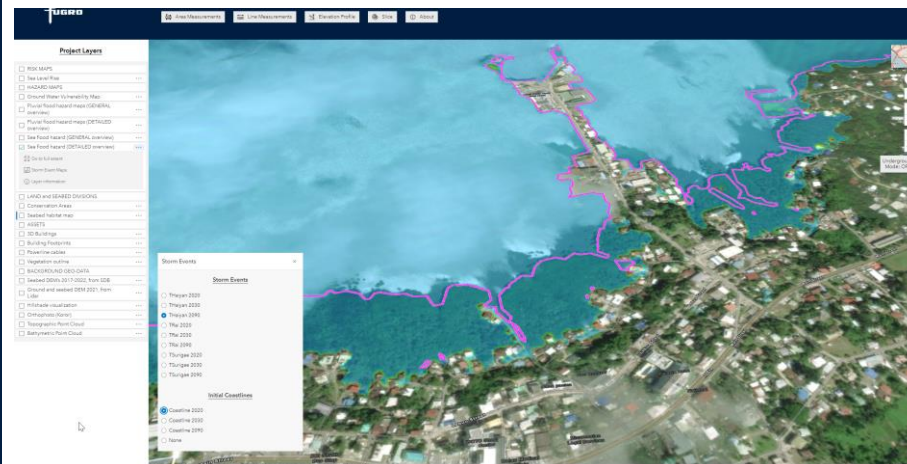

1 month to 12 months
development

Component 2: MODEL

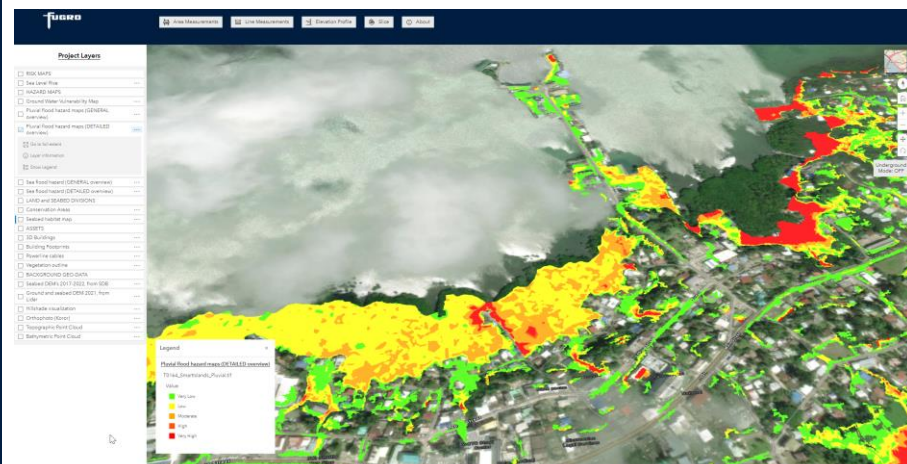

Coastal hazard impact and scenario analytics

Sea level rise simulator
Showing the number of buildings fully or partially inundated

Current and future scenario coastal floods
Combining actual event flood extent (from Fugro's hydrodynamic models) + sea level rise

Pluvial floods
For a 1 in 100-year event (from Fugro's models)

Component 1: MAP

3D spatial mapping & land use
assessment

Digital Surface Model
High-resolution (cm- to
m-scale) of 3D assets,
both natural and built

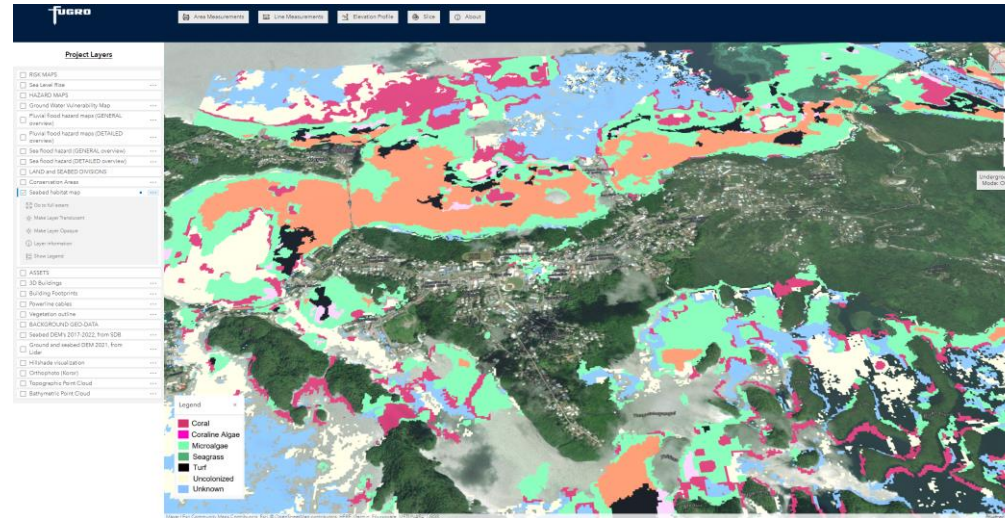

Digital Elevation Model
Bare-earth and marine
surface elevation
(without assets)

**Sense.Lidar asset
classification**
Vegetation, buildings,
ground, cable lines etc.

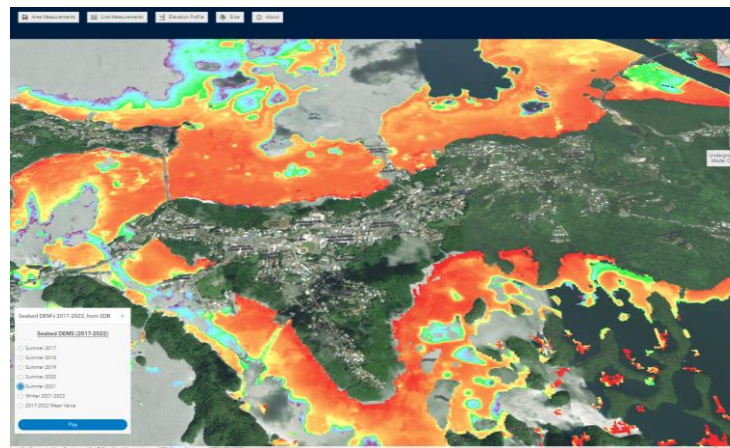

Component 3: MONITOR

Change detection and
adaptation monitoring

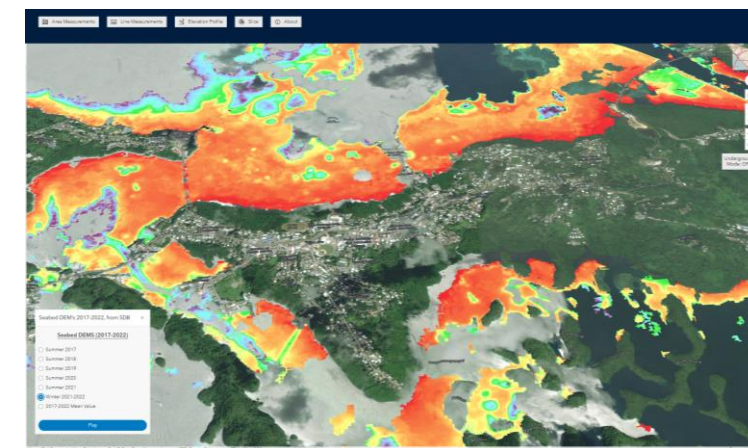

**Seabed habitat
classification**
From Sentinel-2 satellite
subsurface reflectance
