

Concepts for Associations

Raphael Malyankar

NIPWG VTC

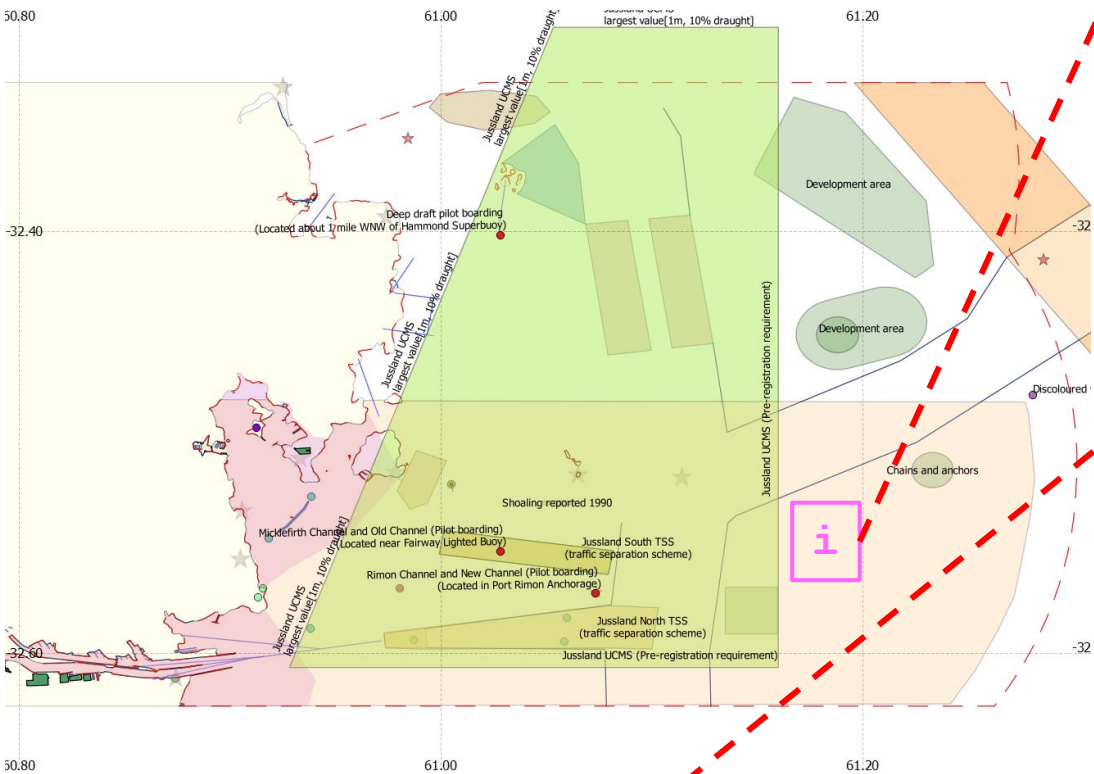

2 March 2023

Sponsored by Canadian Coast Guard

OVERVIEW

- U/I concepts
- Recommendations for Product Specification documents
 - Template language for describing associations for producers
 - Template language for portrayals
- Concepts described in this presentation are discussion items for further consideration

PRODUCER: BASIC UI CONCEPT

Diagram(s), encoding instructions from DCEG, and Remarks from feature catalogue (encoding instructions in editor interface only – Pick report shows FC remarks, entry helper shows DCEG content and diagram(s).)

RECOMMENDATIONS - PRODUCT SPECIFICATIONS

- All (NPUB) product specifications should include **clause(s) summarizing the feature and information associations** in the model. **One or more UML diagrams** capturing the relationships should be included. In order to reduce diagram clutter, **attributes should not be included**.
- The Product Specification should include a section describing feature bindings, preferably as a reproduction, summary, or elaboration of S-100 5-4.2.5.2 and 5-4.2.5.3, though a reference to those clauses may suffice.
 - Based on S-100WG7 discussions, these S-100 clauses *might* be revised soon.
- Product Specifications should describe portrayal of information types common to multiple N PUB product specifications:
 - Schedules (ServiceHours, NonStandardWorkingDay)
 - Regulations, Restrictions, Recommendations, Nautical Information
 - Limitations by vessel characteristics
- The Portrayal section of a Product Specification which uses Applicability information type to describe the applicability of regulations (and recommendations, etc.) to vessels should include the paragraph below.

The text generated [from instances of the information type Applicability] should be linked or otherwise related to the feature or information type to which it applies depending on the nature (and attributes, if any) of the association between Applicability and the feature or information type to which it is associated. For example, the text generated might be preceded by the text of the linked Regulation (for InclusionType associations), or the text generated from Applicability appear in a hover box linked to a geographic feature (for PermissionType associations).

RECOMMENDATIONS - DCEG

- DCEGs should define terms and abbreviations using more accessible language than Product Specifications and S-100.
- Template for common clause describing associations, based on existing clause 2.5 (Associations).
- Each feature table should include a UML diagram...not showing attributes, only associations for the class described by the feature table.
- Each “theme section” in the DCEG should have an introductory section describing the associations between features comprising that theme, to/from other features. Diagram(s) should be included.
- Regulations, schedules, and limitations by vessel characteristics (Applicability) are common to multiple NPUB product specifications. Template clauses are supplied for each of these “themes”.

“MIXED PORTRAYAL” IN PRODUCT SPECIFICATION

11.4 Schedules

Schedule information is encoded in the **ServiceHours** and **NonStandardWorkingDay** information types. Schedules should be displayed as tabulations according to the day of the week. A template for the tabulation is shown in Table 11.2. The objects and attributes from which the displayed information is derived are shown in italics. Implementers may deviate from the layout shown provided the resulting display shows at least the information specified in the table (for example, exceptions from **NonStandardWorkingDay** may be placed in an additional column instead of a separate row, or merged into the *Notes* column).

Table 11.2 - General layout of schedules display

Operations	Days	Times	Notes
(Table sub-header, from <i>featureName</i> if present - omit this row if <i>featureName</i> is not present) Links to other unusual attributes like source and graphic can be included here.			
Normal, Closed, Unmanned OR other: abcde	(Day(s) of week) DoW (single day) OR DoW - DoW (if <i>dayOfWeekIsRange</i> = <i>true</i>) OR DoW, DoW (if <i>dayOfWeekIsRange</i> = <i>false</i>)	(Times of day) hh:mm-hh:mm hh:mm-hh:mm ... <i>timeOfDayStart</i> , <i>timeOfDayEnd</i>	(Additional information) <i>complex attribute</i> <i>information</i>
Attribute <i>categoryOfSchedule</i> From <i>ServiceHours</i> Date ranges <i>fixedDataRange</i> , <i>periodicDataRange</i>			
(repeat according to multiplicity of <i>scheduleByDayOfWeek</i>)			
Exceptions	(fixed and variable date(s) from <i>dateFixed</i> or <i>dateVariable</i>)		(Additional information) <i>complex attribute</i> <i>information</i>
<i>NonStandardWorkingDay</i> associated to the above <i>ServiceHours</i>			
(repeat both rows above, according to multiplicity of <i>ServiceHours</i> associated to the feature or information type)			

Notes:

- (1) The “Normal, Closed, ...” row represents information from **ServiceHours**, the “Exceptions” row from **NonStandardWorkingDay** associated to that **ServiceHours**.
- (2) If there is more than one **ServiceHours** instance associated to the same feature or information type, the rows are repeated. This might be the case if there are different schedules for different types of operations (normal, unmanned, etc.).
- (3) DoW represents *scheduleByDayOfWeek.timeIntervalsByDayOfWeek.dayOfWeek*.
- (4) Times must be ordered according to the sequence of *timeOfDayStart* and *timeOfDayEnd* attributes in the dataset (this allows for encoding multiple periods in the day if needed, for example 08:00 - 12:00 and 13:00 - 17:00).
- (5) The “Notes” column contains the content of the information attribute of **ServiceHours** or **NonStandardWorkingDay** (either the content of the text sub-attribute or a link to the text, as appropriate).
- (6) Inclusion of the header row(s) is left to implementer discretion.
- (7) Other attributes (for example, *graphic*) are not expected to be used for encoding schedule information, but if populated should be accessible via the “Notes” column or in header or trailer rows.

Since S-100 Edition 5.0.0 portrayal does not provide for specifying templates for text formatting, the implementation of tabular forms must be left to implementers for this edition. As a provisional alternative, information may be displayed in text form, with rows of Table 11.2 converted to phrases:

Normal operation: (date range) DoW-DoW, hh:mm-hh:mm, (additional information/link)
Exceptions: (fixed/variable dates), (additional information/link)

PRODUCTION STRATEGIES – DATASET CREATION

12.4 Production hints and recommended practices (informative)

12.4.1 Capturing the application of a regulation, recommendation, etc. to specified kinds of vessels

Encoders may find it easiest to capture the application of a regulation (recommendation , etc.) to a class or set of vessels in three phases:

- (1) Encode the operative part of the regulation (the part that describes what the vessels subject to the regulation must or must not do), creating an instance of **Regulation** (or **Recommendation**, etc., as appropriate). Descriptions of what kinds of vessels are subject to the regulation must be excluded from the content of the **Regulation** instance.
- (2) Create an **Applicability** information type and encode the description of what kinds of vessels are subject to (or exempted from) the regulation.
- (3) Link the two using an **InclusionType** with *membership=included* if the vessels described by **Applicability** are subject to the regulation, or *membership=excluded* if they are explicitly exempted from the regulation.

It is not necessary to create separate instances of the regulation for inclusion and exclusion.

12.4.2 Capturing the permissibility or otherwise of a geographic feature for specified kinds of vessels

Encoders may find it easiest to capture the permissibility of a feature to specified kinds of vessels in three phases.

- (1) Create the geographic feature if it does not already exist.
- (2) Create an **Applicability** information type and encode the description of what kinds of vessels are required to use the geographic feature.
- (3) Link the two using a **PermissionType** with *categoryOfRelationship = required*.

For the other relationships (prohibited, not recommended, etc.) steps 2 and 3 should be modified accordingly (i.e., if use by certain kinds of vessels is "not recommended" encode the description of that kind of vessels in an **Applicability** and create a linking **PermissionType** with *categoryOfRelationship = not recommended*).

It is not necessary to create a separate instance of the geographic feature for each type of relationship.

12.4.3 Constructing the Applicability information type

Where the source material describes complex conditions, encoders may find it useful to write out the conditions in structured language with grouping parentheses, for example, as "(condition A) AND (condition B) AND (condition C)", or draw diagrams, before encoding **Applicability** and its associations.

Note that the model limitation on mixing logical connectives means some forms of conditions which use "nesting" cannot be encoded in a single **Applicability** instance and multiple instances must be created.

EXAMPLE: The complex condition "(condition A) AND ((condition B) OR (condition C))" must be encoded as two **Applicability** instances, one with "(condition A) AND (condition B)" and the other with "(condition A) AND (condition C)".

Table 12.2 - Example of conversion of complex condition to multiple simple conditions

Complex condition	Encode as
(condition A)	Applicability 1: (condition A) AND (condition B)
AND	Applicability 2: (condition A) AND (condition C)
((condition B) OR (condition C))	

Data producers may contact NIPWG with questions about encoding complex conditions.

As a last resort, conditions may be written as phrases in natural language and encoded in the *information* attribute. It is acceptable for an **Applicability** to have only the *information* attribute populated.

CONCLUSION

- NPOBs use of associations and information types is complex.
 - Pick report-like portrayal is insufficient especially for associations.
 - Producer U/I based purely on data objects is likely to be difficult to use.
 - Other concepts are needed for both production and end-user portrayal interfaces.
- Extensions may be needed
 - Support in Product Specifications: Extensions to Application Schema, GML format, portrayal specification?
 - Support in S-100? (Feature Catalogue model, Portrayal Catalogue, GML format)
- Participation Invited!
 - Provide user perspectives in identifying current problems and needs
 - Review recommendations for documentation and product specifications
 - Send input and questions to Raphael Malyankar
 - More materials at <https://iho.int/en/nipwg-vtc-2023> and <https://iho.int/en/nipwg-vtc-2022> (NIPWG-VTC03-09A Rev1)
